# Loops in R

Daniel E. Weeks

Department of Human Genetics School of Public Health University of Pittsburgh

#### Location

This slide set is in the Lectures repository in the 03\_R\_loops folder.

### Learning objectives

- To learn about the different types of loops in R
  - for loops
  - while loops
  - repeat loops
  - Vectorize operations

### Don't repeat yourself

```
print("i = 1")

## [1] "i = 1"

print("i = 2")

## [1] "i = 2"

print("i = 3")

## [1] "i = 3"
```

### Loops in R

A 'for' loop, iterating through the values of i:

```
for (i in 1:3) {
    print(paste("i =", i))
}
## [1] "i = 1"
## [1] "i = 0"
```

```
## [1] "i = 1"
## [1] "i = 2"
## [1] "i = 3"
```

### A while loop

```
i <- 1
while (i < 4) {
    print(paste("i =", i))
    i <- i + 1
}

## [1] "i = 1"
## [1] "i = 2"
## [1] "i = 3"</pre>
```

### A repeat loop

```
i <- 1
repeat {
    print(paste("i =", i))
    i <- i + 1
    if (i > 3)
        break
## [1] "i = 1"
## [1] "i = 2"
## [1] "i = 3"
```

### Vectorize where possible

```
a <- 1:10
b <- 1:10
res <- numeric(length = length(a))
for (i in seq_along(a)) {
    res[i] <- a[i] + b[i]
}
res
## [1] 2 4 6 8 10 12 14 16 18 20</pre>
```

Example from here, CC-BY 4.0

### Vectorize where possible

```
а
   [1] 1 2 3 4 5 6 7 8 9 10
##
b
##
   [1] 1 2 3 4 5 6 7 8 9 10
res2 <- a + b
res2
   [1] 2 4 6 8 10 12 14 16 18 20
##
all.equal(res, res2)
## [1] TRUE
Example from here, CC-BY 4.0
```

### Options for loops in R

- for, while, repeat loops
- Vectorized operations
- Use apply family of functions
  - Optimized to apply functions over rows or columns of a data frame.

#### Loops

- Loops can be slow in R.
  - Avoid for loops where possible to vectorize instead.
  - Don't grow objects within a loop (e.g., with rbind)
  - Pre-allocate a 'results' object and fill it in as you go.
- Fine to use loops if you are careful.

# Example loop

```
test <- function(k) {
    print(paste0("file", k, "_snp1.txt"))
    print(paste0("file", k, "_snp2.txt"))
    print("----")
}</pre>
```

# Example loop

```
for (i in 1:2) {
    test(k = i)
}

## [1] "file1_snp1.txt"

## [1] "file1_snp2.txt"

## [1] "------"

## [1] "file2_snp1.txt"

## [1] "file2_snp2.txt"

## [1] "-------"
```

### What type of loop when?

- If you know in advance how many loops you'll need, use a for loop
  - Example: looping over N=5 subjects.
- If you know the loop exit criterion but not how many loops, use a while loop or a repeat loop
  - while: tests the condition at the start of the loop
  - repeat: tests the condition at the end of the loop
  - Example: Repeatedly iterate a function optimization step until it converges.
- Caution: When using a while or a repeat loop, be sure the exit condition will be satisfied to avoid infinite loops.

### Loop speed

```
system.time({
    a <- NULL
    for (i in 1:1e+07) a[i] <- i
})

## user system elapsed
## 1.313 0.123 1.437</pre>
```

 $\label{lem:com/questions/2908822/speed-up-the-loop-operation-in-r} Example from $https://stackoverflow.com/questions/2908822/speed-up-the-loop-operation-in-r$ 

### Loop speed

```
system.time({
    a \leftarrow rep(1, 1e+07)
    for (i in 1:1e+07) a[i] <- i
})
##
      user system elapsed
##
     0.230 0.010 0.242
system.time(a <- 1:1e+07)
##
      user system elapsed
##
                 0
```

#### Timing example

Why does pre-allocating a vector speed things up so much?

Here is a nice blog post illustrating different ways to do things in R: *link* 

See also the excellent 'R Inferno': link

### Another reason some loops are slow

See the 'Loops' section at the bottom of this page of 'Advanced R': *link*.

#### R memory usage

A data frame is stored in memory in column order, looped around.

Adding a row onto the end can be slow because you have to shift all the data around.
